

NO SHORT CUTS AT ALC

ALC fit a wide variety of brackets to their columns. In most cases the brackets are factory fitted, although a few are supplied loose for on-site attachment.

Factory fitted means welded in. Aluminium lends itself to elegant shapes and finishes, and ALC welders make sure that the elegance is retained.

But the job does not stop there. Besides the welding, ALC now fit, as standard, a braided stainless steel wire lanyard which is bolted in place to ensure the bracket cannot become detached from the column no matter what impact may be suffered after installation.

The lanyards are pre-formed, with steel eyes at either end which locate on the securing bolts. The bolts are stainless steel, and are positioned to be unobtrusive in the finished assembly.

And besides the lanyard, ALC also fit, as standard, a rope pull through. This is secured at both ends in transit so it reaches site in a ready-to-use form, to enable easy cable routing.

These two items illustrate yet again the superior product quality from ALC, and reinforce the company's position as best value supplier.

Further technical details of the ALC product range are available from our Technical Support Engineer, Paul Mason
